

Problem Solutions

Define CS, fit into CC

1. CUSTOMER SEGMENT(S)

CS

- Individuals at risk of hypertension
- Patients with a family history of cardiovascular diseases
- Hospitals and healthcare providers
- Health monitoring platforms and wearable device companies
- Health-conscious individuals interested in preventive healthcare

6. CUSTOMER CONSTRAINTS

CC

What users want to accomplish:

- Monitor blood pressure trends over time
- Detect hypertension risks early
- Understand the relationship between lifestyle and BP
- Get personalized health insights and recommendations

5. AVAILABLE SOLUTIONS

AS

Currently, blood pressure is monitored using digital BP monitors, hospital checkups, mobile health apps, and wearable devices like smartwatches. These solutions help measure and track blood pressure levels, but most of them only provide basic monitoring and lack advanced analytics or machine learning capabilities for early prediction of hypertension risk.

Focus on J&P, tap into BE, understand RC

2. JOBS-TO-BE-DONE / PROBLEMS

J&P

Users need an efficient way to monitor blood pressure trends and detect hypertension risk at an early stage. Current methods mainly provide measurements but do not analyze patterns or predict future risks. There is a need for a system that can analyze health data, identify risk factors, and provide early warnings and insights for better health management.

9. PROBLEM ROOT CAUSE

RC

The main causes of hypertension include unhealthy lifestyle habits (poor diet, lack of physical activity, high stress), genetic predisposition, and lack of regular health monitoring. Additionally, limited awareness and absence of predictive tools make early detection difficult, leading to delayed diagnosis and increased health risks.

7. BEHAVIOUR

BE

7.1 Online Channels

- Mobile health applications
- Telemedicine platforms
- Health and fitness tracking apps
- Hospital websites and online patient portals
- Social media health awareness campaigns

7.2 Offline Channels

- Hospitals and clinics
- Diagnostic laboratories
- Health camps and medical screenings

Focus on J&P, tap into BE, understand RC

Identify strong TR & EM	3. TRIGGERS TR Events or factors that motivate users to take action: - Sudden symptoms such as headaches, dizziness, or fatigue - Doctor recommendations for regular BP monitoring - Awareness campaigns about hypertension risks - Health check-ups showing borderline blood pressure levels - Family history of hypertension or heart disease - Increased interest in preventive healthcare and fitness tracking	10. YOUR SOLUTION SL Predictive Pulse is a machine learning–based healthcare system designed to predict and analyze blood pressure levels using patient health data such as age, BMI, heart rate, lifestyle habits, and medical history. The system uses supervised learning algorithms to identify patterns in health data and classify patients into different hypertension risk levels. It provides early warnings, visual insights, and preventive recommendations to help users manage their cardiovascular health effectively. .	8. CHANNELS of BEHAVIOUR CH 8.1 Online Channels - Mobile health applications - Telemedicine platforms - Health and fitness tracking apps - Hospital websites and online patient portals - Social media health awareness campaigns 8.2 Offline Channels - Hospitals and clinics - Diagnostic laboratories - Health camps and medical screenings - Pharmacies and healthcare centers development.	Identify strong TR & EM
	4. EMOTIONS: BEFORE / AFTER EM Before Using the Solution - Anxiety about health condition - Lack of awareness about blood pressure trends - Fear of developing heart diseases - Confusion about interpreting medical data After Using the Solution - Confidence in monitoring personal health - Better understanding of blood pressure patterns - Sense of control over lifestyle and health decisions - Early warning and preventive care			

Project Title - Predictive Pulse: Harnessing Machine Learning for Blood Pressure Analysis
